

ACCOUNTS RECEIVABLE & ACCOUNTS PAYABLE TRACKER CASE STUDY

Evangeline Amadi | Bookkeeping & Data Entry
Simulated Practice Project • August 2026

Project Overview

This simulated project demonstrates the ability to organize customer receivables and supplier payables, track payments, calculate outstanding balances, and apply basic aging analysis.

Business Scenario

A small food-products business has several customer invoices and supplier bills. The objective was to build a tracker that clearly shows what customers still owe the business and what the business still owes suppliers.

Work Performed

- Created separate Accounts Receivable and Accounts Payable schedules.
- Recorded invoice/bill dates, due dates, amounts and payments.
- Calculated outstanding customer balances and supplier balances.
- Standardized payment status categories.
- Calculated days outstanding as of 20-Aug-2026.
- Grouped outstanding balances into aging buckets.
- Created a summary sheet showing total receivables and payables.

Portfolio Results

Metric	Result
Total Accounts Receivable	■770,000
Customer Payments Received	■595,000
Outstanding Accounts Receivable	■175,000
Total Accounts Payable	■475,000
Supplier Payments Made	■150,000
Outstanding Accounts Payable	■325,000

Aging Analysis

The tracker applies basic aging buckets (Current, 1–30, 31–60, 61–90 and 90+ days) based on the due date and a stated reporting date. This helps a business prioritize collection and supplier-payment follow-up.

Skills Demonstrated

- Accounts Receivable tracking

- Accounts Payable tracking
- Invoice and bill recording
- Payment reconciliation
- Outstanding-balance calculation
- Aging analysis
- Spreadsheet organization and reporting
- Attention to detail

Portfolio Note

This is a simulated practice project created to demonstrate bookkeeping and spreadsheet skills. It is not presented as paid client work.
