

EXCEL / GOOGLE SHEETS DATA ENTRY & DATA CLEANING CASE STUDY

Evangeline Amadi | Data Entry & Bookkeeping Support
Simulated Practice Project • August 2026

Project Overview

This simulated project demonstrates accurate data entry, data cleaning, standardization, validation and summary reporting using a small sales-order dataset.

Business Scenario

A small food-products business supplied eight sales records containing customer, product, quantity, pricing and payment information. The task was to organize the raw records into a clean, usable dataset and produce a management summary.

Work Performed

- Entered and organized sales records into a structured spreadsheet.
- Standardized customer and product naming.
- Standardized payment-status terminology.
- Converted dates and numeric fields into consistent formats.
- Validated each line by checking quantity × unit price against the recorded amount.
- Separated raw data from cleaned data so the original records remain available for reference.
- Created a summary sheet showing order count, sales value and payment-status counts.

Quality-Control Result

All eight records passed the amount validation check in the simulated dataset. This demonstrates a simple data-quality control: verifying calculated values against source values before reporting.

Summary Results

Metric	Result
Total Orders	8
Total Sales Value	■1,040,000
Paid Orders	4
Partially Paid Orders	2
Unpaid Orders	2
Records Requiring Review	0

Skills Demonstrated

- Excel/Google Sheets data entry

- Data cleaning and standardization
- Spreadsheet formatting and organization
- Basic data validation
- Record checking and quality control
- Summary reporting
- Attention to detail

Portfolio Note

This is a simulated practice project created to demonstrate data-entry and spreadsheet skills. It is not presented as paid client work.
